

LIFE CYCLE ANALYSIS (LCA)

Definition

Life Cycle Analysis (also called Life Cycle Assessment) is a technique to assess environmental impacts associated with all the stages of an asset's life, from cradle to grave, from raw material extraction, materials processing, manufacture, distribution, use and landscape context, repair and maintenance, and disposal or recycling.

LCA provides a wider consideration of environmental issues by:

- Compiling an inventory of relevant energy and material inputs, and environmental gains and losses;
- Evaluating the potential impacts associated with identified inputs and losses;
- Interpreting the results to help make a more informed decision.

Examples of relevance to COST RELY are: (i) the timescale required to balance the energy to produce photovoltaic systems and the energy saved through their use; (ii) assessing the carbon budgets of wind farms on peatlands.
